Nomado Telecom to launch internet telephony service

27th May 2008

By Sheetal Vyas

Nomado Telecom, a provider of telecommunications services, is introducing a new internet telephony service for private users and small and medium-sized enterprises.

The new service, according to the Europe-based communications company, will enable users to enjoy enhanced communications in a cost-effective way on both fixed and mobile lines for national as well as international calls.

According to Nomado, the service aims to facilitate the benefits offered by internet telephony, which enables users to make calls for longer, frequently and at a reduced cost. The company says that the technology has been designed in such a way that the users do not require a computer, and in certain cases an internet connection, to make calls.

Nomado says that the service is provided by means of a box installed between the internet connection and the traditional telephone. The instrument, described by the company as the miracle box facilitates the management of the service.

The user is not required to configure the box because it automatically detects the settings and enables the user to make calls to any type of number, throughout Belgium and worldwide. All these facilities are provided with no additional subscription or installation charges.

Olivier Vermeersch, the managing director of Nomado, said: "In developing our product, our main concern was to remove all the technical or psychological barriers which might still be making some people hesitate from using the internet to make substantial savings on their phone bill. Now everyone can benefit from unlimited calling for a few eurocents, without needing to know the slightest thing about computers."
